Proposal for a new cooling method for water-cooled PCs（正式公開）
正式公開：2026.02.14（土）時間：午前０９時００分

【Video動画】
Intentionally creating air bubbles.
A video of air bubbles flowing through the drain instead of from the send to the return.
You can see that this prevents air bubbles from flowing from Send to Return.
1. Large bubbles expected under normal operation
Almost all of it flows into the drain, with only a small amount flowing into the return (the bubbles disappear perfectly in the second circulation)

2. Remove air bubbles
What happens if you unplug the hose while the power is off?
If you unplug the hose because the pressure is high, water will spray out.

3. Variable pump drive voltage
Video of the Hose (pipe) vibrating when the pump power supply (5V, 9V, 12V) is running
A cause by high tube pressure (Hose/Pipe).
4. Capillary (prototype)
The works to prevent air bubbles from flowing from the Send to Return, and the water in the hose flows almost evenly.
Reserve tank / Master bag (prototype)
A acting as a "Master bag."

Proposal for a new cooling method for water-cooled PCs
【Innovation - Sustainable Development Goals】
A new proposal that takes into account the impact on the natural environment. AI data center build boom to become water positive, and consideration of environmental issues, "sustainable goals", and creating an environmentally friendly PC cooling and AI data center cooling systems research and development.

Application example
・Cooling air conditioner compressors
・Power motor cooling
・Cooling the computer
Large cooling towers, such as those in AI data centers, can also be applicable for cooling.

Innovation
Sustainable Development Goals
A new proposal that takes into account the impact on the natural environment.

AI data centers
For example, the economic benefits would be significant if even a few percent of this "6.4 billion gallons (approximately 24 billion liters or 24 million cubic meters)" could be reduced.

Proposal for a new cooling method for water-cooled PCs
The new cooling method presented here can solve the exemplary problem (air bubbles entering the pipe (tube)).

Declaration
This new water cooling method can significantly reduce the amount of cooling water used in AI data centers.

By adopting this new cooling method, economic benefits of "a few percent of GDP" are expected to be achieved.

Achieving goals, not goals.
It only makes sense if you achieve your goal, not just any other one.

【Proposal for a new cooling method for water-cooled PCs】
The new cooling method presented here can solve the exemplary problem (air bubbles entering the pipe (tube)).

For example, the economic benefits would be significant if even a few percent of this "6.4 billion gallons (approximately 24 billion liters or 24 million cubic meters)" could be reduced.

By adopting this new cooling method, economic benefits of "a few percent of GDP" are expected to be achieved.

Achieving goals, not goals.
It only makes sense if you achieve your goal, not just any other one.

【Summary】
A cooling technology related to water-cooled PCs.
It is a groundbreaking initiative. It has been proven and verified through prototype experiments.

Intentionally creating air bubbles.
A video of air bubbles flowing through the drain instead of from the send to the return.
You can see that this prevents air bubbles from flowing from Send to Return.

1. Large bubbles expected under normal operation
Almost all of it flows into the drain, with only a small amount flowing into the return (the bubbles disappear perfectly in the second circulation)

2. Remove air bubbles
What happens if you unplug the hose while the power is off?
If you unplug the hose because the pressure is high, water will spray out.

3. Variable pump drive voltage
Power supply: 3.5V
Video of the Hose (pipe) vibrating when the pump power supply (5V, 9V, 12V) is running
Experimental power supply: 3.5V (rated voltage: 12V)
A cause is high water pressure inside the hose. Additionally, the flow rate is circulating faster.

4. Capillary (prototype)
The works to prevent air bubbles from flowing from the Send to Return, and the water in the hose flows almost evenly.
Reserve tank / Master bag (prototype)
A acting as a "Master bag."

【Background of this study】
The cooling water for AI data center equipment.
First, the cooling water for AI data center equipment is "circulated by running water through pipes," just like the cooling water for water-cooled PCs.

The problem here is that the used cooling water after circulating is discarded rather than reused. And some of this used cooling water is reused around AI data center equipment, but it appears to been discarded.

It appears that there are currently no Purification equipment facilities in place to reuse used cooling water.

【Issue】
For example, a hydraulic crane or a hydraulic brake. When air (Air-bubbles) enters the inside, it becomes like a sponge, and the pressure inside (hydraulic pressure, water pressure) drops suddenly.

As such, it seems that the pump power has increased to pump more water into the pipes, increasing the water pressure.

The current situation is that there is no device to remove air bubbles that have entered the pipe (tube), and no measures have taken to improve circulation efficiency.

Current issues
When air (Air-bubbles) enters the inside, the water circulation efficiency decreases.

Key: The efficiency of equipment operation is important.

Material
①Water Efficiency
https://datacenters.lbl.gov/water-efficiency
"As such, ensuring that efficiency is viewed holistically - from the IT equipment, to the cooling required to maintain a hospitable environment for equipment is paramount."
②Quantifying Power Demand from Artificial Intelligence

https://www.breckinridge.com/insights/details/quantifying-power-demand-from-artificial-intelligence/
"More recently, power demand forecasts accelerated with some estimating up to 25 percent growth by 2030, equating to 3 to 4 percent annual growth.1"
③The Water Footprint of AI: Implications for Investors

https://www.breckinridge.com/insights/details/the-water-footprint-of-ai-implications-for-investors/
"Corporate bond issuers in water-intensive industries could see increased costs for operations on account of reduced water supply or increased water rates in certain locations."

【Common understanding】
The efficiency of equipment operation is important.

・Water demand in AI data centers leads to higher water bills for the general public.
・GDP: expected to be equivalent to a few percent or more.

Currently, we have not released accurate figures on the actual state of each company's AI data centers. It probably consumes a lot more water than it should.

So, the biggest challenge is how to achieve high efficiency. As things stand, companies are unable to solve this problem.

The "Proposal for a new cooling method for water-cooled PCs" introduced here is a water cooling system that can smartly solve these problems (challenges).

But even if someone like me makes a groundbreaking invention, they can't bring it to market.

Please recommend me so that I can win the Nobel Prize.
If I am honored and awarded the Nobel Prize, it will be a global move. The major companies will come together to bring the results of my research to market. Please recommend me so that I can win the Nobel Prize.

-----

【Title of the Invention発明の名称】
【Proposal for a new cooling method for water-cooled PCs】
I want to share information about my new business model and find people who can invest in VC.

【Use of the invention発明の用途】
Seek cooperation (VC investment) for commercialization.

Examples (Example: Preliminary evaluation)
・Public photo: 3-Port type
・Unreleased: 4-Port type (improved)
4-Port Reserve Tank / Master Bag (prototype)
The functions are complete as a Master Bag.
It becomes possible to increase the pipe pressure to a high level. It has the effect of increasing the speed of flow.

Application example
・Cooling air conditioner compressors
・Power motor cooling
・Cooling the computer
Large cooling towers, such as those in AI data centers, can also be applicable for cooling.

【Summary要約】
A cooling technology related to water-cooled PCs.
It is a groundbreaking initiative. It has been proven and verified through prototype experiments.

【The constituent features of the invention本発明の特徴】
Brief Summary of Features
It can increase the water pressure (pipe pressure) flowing through pipes (copper pipes or hoses), dramatically suppress the generation of bubbles, including internal foam, and accelerate flow speed through water exchange. For example, if you slowly disconnect a hose (copper pipe or piping) nipple, you can see that the internal water shoots out due to the high pipe pressure (It has proven in empirical experiments). This invention can also be considered viable as a utility invention.

【Traditional challenges and solutions従来の課題と解決方法】
【Important points】
Key configurations (detailed descriptions of technical rationale, etc, will be addressed separately after the NDA/PoC has concluded.)
(Solving the problem)
If you would like to "VC invest" in commercialization, we look forward to hearing from you.
Disclosure of materials, including detailed explanations of technical rationale, etc., will be disclosed to the extent that disclosure is possible if you enter into an NDA (Confidentiality) and PoC (Technical Verification). First, please conclude an NDA.
Major configurations (detailed explanations of technical rationale, etc., will be provided separately after the NDA/PoC is concluded)

Brief Summary of Features
It can increase the water pressure (pipe pressure) flowing through pipes (copper pipes or hoses), dramatically suppress the generation of bubbles, including internal foam, and accelerate flow speed through water exchange. For example, if you slowly disconnect a hose (copper pipe or piping) nipple, you can see that the internal water shoots out due to the high pipe pressure (It has proven in empirical experiments). This invention

can also be considered viable as a utility invention.

【Examples実施例】
(Configuration)
Copper tube 4mm＋ Heat sink (prototype(Preliminary Evaluation))
Capillary (prototype)
The works to prevent air bubbles from flowing from the Send to Return
Reserve tank / Master bag (prototype)
A acting as a "Master bag."

(Feature 1)
Summer: Room temperature (atmospheric temperature) ＋about 5 degrees
Winter: Room temperature (atmospheric temperature) ＋3 degrees
No air bubbles (bubbles containing bubbles) are generated inside the pipe when the pump is turned on or off.
The submersible pump used in the experiment is ultra-compact (a pump rated at 12V is driven at 5V or less)
(Feature 2)
Summer: Natural circulation in environments with maximum temperature differences
Winter: As temperatures rise, natural circulation slows
The ultra-compact pump used in the experiment and the vacuum pump used to vent the air
Ultra-compact Water Pump (for evaluation experiments)
Drive rated 12V at 5V or less.
8mm tubes are too thick, so convert to 4mm.
Air pump (made by a well-established maker)
Conveniently converted into a vacuum pump
Used to vent air in water-cooled pipes
Initial piping post-treatment (vacuum pump omitted)
Vacuum pump to remove air from the pipe
The vacuum pump is used to vent the air in the water-cooled pipe (Finally remove).

Abstract, "It is estimated that 2.4 billion people live in water-stressed countries (United Nations Department of Economic and Social Affairs, 2023) and two-thirds of the global population face freshwater shortages for at least one month per year (Mekonnen and Hoekstra, 2016). "

高学歴えりーと馬鹿無能列伝

After which:

① Linkedin;
linkedin.com I created a new account and posted, but the next day I couldn't log in (account frozen?).
② Sciencex;
I am considering publishing a paper. I look forward to your response as to how I can post it.
When I approached sciencex.com to see if I could publish my paper, they never responded.
③ 経済産業省（日本）;
When they asked the Japanese Ministry of Economy, Trade, and Industry for cooperation, they received no response and were treated as if they had ignored.

About ①from③
It's the "hidamari" of the highly educated elite!
They are elite idiots and incompetent.

【Column】
Duolingo (4 English skills) score 130（最高点）達成
でも、日本では英会話する機会ない。
Nice to meet you, this is my first post.

Duolingo (4 English skills) score 130
Around November last year, I achieved a score of 130 (the highest score).
Still, in Japan, there are no opportunities to converse in English. It is closed off.

【My self-introduction】
I am a music and audio specialist.
My papers on acoustics and more are registered.
